## Recall: GADTs

# Assignment Project Exam Help

Generalised Algebraic Datatypes (*GADTs*) is an extension to Haskell that, among other things, allows datatypes to be defined with different constructors having different return types.

```
{-# LANGUAGE GADTs #-}
-- Unary natural numbers
data Nat = Z | S Nat
-- is the same as
data Nat :: * where
  Z :: Nat
  S :: Nat -> Nat
```

<https://eduassistpro.github.io/>

## The printf function

# Assignment Project Exam Help

Consider the well known C function printf:

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

## The printf function

# Assignment Project Exam Help

Consider the well known C function printf:

printf <https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

## The printf function

# Assignment Project Exam Help

Consider the well known C function printf:

`printf` <https://eduassistpro.github.io/>

In C, the type (and number) of parameters passed to this function is specified by the first parameter (the format string).

Add WeChat [edu\\_assist\\_pro](#)

## The printf function

**Assignment Project Exam Help**

To do a similar thing in Haskell, we would like to use a richer type that allows us to define a function whose subsequent parameter is determined by the first.

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

## The printf function

To do a similar thing in Haskell, we would like to use a richer type that allows us to define a function whose subsequent parameter is determined by the first.

```
data Format :: * -> * w
```

```
End :: Format (
```

```
Str :: Format t -
```

```
Dec :: Format t -> Format (Int, t)      -- %d
```

```
L :: String -> Format t -> Format t
```

```
deriving instance Show (Format ts)
```

```
-- just like deriving (Show) for normal data types.
```

Our format strings are indexed by a tuple type containing all of the types of the %directives used.

## The printf function

# Assignment Project Exam Help

is written:

```
L "Hello" $ Str $ L " You are "  
$ Dec $ L " years old!" End
```

<https://eduassistpro.github.io/>  
Add WeChat edu\_assist\_pro

## The printf function

# Assignment Project Exam Help

```
printf :: Format ts -> ts -> IO ()
printf End () =
  pure ()
printf (Str fmt)
  do putStr s
printf (Dec fmt) (i,ts) =
  do putStr (show i)
printf (L s fmt) ts =
  do putStr s; printf fmt ts
```

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

## Vectors

Define a natural number kind to use on the type level:

```
data Nat = Z | S Nat
```

# Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

## Vectors

Define a natural number kind to use on the type level:

```
data Nat = Z | S Nat
```

Our length-indexed

```
data Vec (a :: *) :: Nat -> *
  Nil    :: Vec a Z
  Cons   :: a -> Vec a n -> Vec a (S n)
```

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

## Vectors

Define a natural number kind to use on the type level:

```
data Nat = Z | S Nat
```

Our length-indexed

```
data Vec (a :: *) :: Nat -> Type
  Nil  :: Vec a Z
  Cons :: a -> Vec a n -> Vec a (S n)
```

The functions `hd` and `tl` can be total:

```
hd :: Vec a (S n) -> a
hd (Cons x xs) = x
tl :: Vec a (S n) -> Vec a n
tl (Cons x xs) = xs
```

## Vectors, continued

Our map for vectors is as follows:

# Assignment Project Exam Help

```
mapVec :: (a -> b) -> Vec a n -> Vec b n
```

```
mapVec f Nil = Nil
```

```
mapVec f (Cons x xs)
```

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

## Vectors, continued

Our `map` for vectors is as follows:

```
mapVec :: (a -> b) -> Vec a n -> Vec b n
```

```
mapVec f Nil = Nil
```

```
mapVec f (Cons x xs)
```

### Properties

Using this type, it's impossible to write a `map` of length of the vector.

**Properties are verified by the compiler!**

## Appending Vectors

Example (Problem) **Assignment Project Exam Help**

```
appendV :: Vec a m -> Vec a n -> Vec a ???
```

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

## Appending Vectors

### Example (Problem)

```
appendV :: Vec a m -> Vec a n -> Vec a ???
```

We want to write

for

kind Nat.

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

## Appending Vectors

Example (Problem)

```
appendV :: Vec a m -> Vec a n -> Vec a ???
```

We want to write

for

kind Nat.

We can define a nor

```
plus :: Nat -> Nat -> Nat
```

```
plus Z y = y
```

```
plus (S x) y = S (plus x y)
```

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

## Appending Vectors

Example (Problem)

```
appendV :: Vec a m -> Vec a n -> Vec a ???
```

We want to write

for

kind Nat.

We can define a nor

```
plus :: Nat -> Nat -> Nat
```

```
plus Z y = y
```

```
plus (S x) y = S (plus x y)
```

This function is not applicable to **type-level** Nats, though.

Assignment Project Exam Help

Add WeChat edu\_assist\_pro

## Appending Vectors

Example (Problem)

```
appendV :: Vec a m -> Vec a n -> Vec a ???
```

We want to write

for

kind Nat.

We can define a nor

```
plus :: Nat -> Nat -> Nat
plus Z y = y
plus (S x) y = S (plus x y)
```

This function is not applicable to **type-level** Nats, though.

⇒ we need a **type level function**.

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

## Type Families

Assignment Project Exam Help

Type level functions, also called *type families*, are defined in Haskell like so:

```
{-# LANGUAGE Ty
type family Plu
  Plus Z      y = y
  Plus (S x) y = S (Plu
```

We can use our type family to define appendV:

```
appendV :: Vec a n -> Vec a m -> Vec a (Plus n m)
appendV Nil      ys = ys
appendV (Cons x xs) ys = Cons x (appendV xs ys)
```

<https://eduassistpro.github.io/>  
Add WeChat edu\_assist\_pro

## Concatenating Vectors

Example (Problem)

```
concatV :: Vec (Vec a m) n -> Vec a ???
```

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

## Concatenating Vectors

### Example (Problem)

```
concatV :: Vec (Vec a m) n -> Vec a ???
```

We want to write  $m * n$  in the ??? above, but we do not have times defined for kind `Nat`.

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

## Concatenating Vectors

### Example (Problem)

```
concatV :: Vec (Vec a m) n -> Vec a ???
```

We want to write  $m * n$  in the ??? above, but we do not have times defined for kind `Nat`.

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

## Concatenating Vectors

### Example (Problem)

```
concatV :: Vec (Vec a m) n -> Vec a ???
```

We want to write  $m * n$  in the ??? above, but we do not have times defined for kind `Nat`.

```
{-# LANGUAGE TypeFamilies -}
```

```
type family Times (a :: Nat) (b :: Nat) :: Nat where
```

```
  Times Z n = Z
```

```
  Times (S m) n = Plus m (Times m n)
```

We can use our type family to define `concatV`:

```
concatV :: Vec (Vec a m) n -> Vec a (Times n m)
```

```
concatV Nil = Nil
```

```
concatV (Cons v vs) = v `appendV` concatV vs
```

## Filtering Vectors

# Assignment Project Exam Help

Example (Prob

```
filterV :: (a -> Bo
```

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

## Filtering Vectors

# Assignment Project Exam Help

### Example (Prob

```
filterV :: (a -> Bool)
```

What is the size of the result of filter?

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

## Filtering Vectors

# Assignment Project Exam Help

Example (Problem)

```
filterV :: (a -> Bo
```

We do not know the s

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

## Filtering Vectors

### Example (Problem)

```
filterV :: (a -> Bo
```

We do not know the s

We can use our type f

```
filterV :: (a -> Bool) -> Vec a n -> [a]
```

```
filterV p Nil = []
```

```
filterV p (Cons x xs)
```

```
    | p x == True -> x : filterV p xs
```

```
    | otherwise -> filterV p xs
```
